Preface	5
1 Introduction	7
1.1 First 1000 days	7
1.2 Relevance of child development	7
1.3 Limitations of stunting	7
1.4 Measuring neurocognitive development	7
2 Short history	9
2.1 Growth and development	9
2.2 Gesell maturation theory, Piaget stages, Kohlberg stages	9
2.3 One number for development	9
2.4 Current situation: Bayley, Griffiths, IQ, domains	9
3 Comparisons	11
3.1 Types of comparisons needed	11
3.2 Problems of age-based measurement	11
3.3 What is a latent variable	11
3.4 Item response functions	11
3.5 Person response functions	11
3.6 Family of IRT models	11
4 Rasch model	13
4.1 Rasch model	13
4.2 Perfect symmetry	13
4.3 Parameter separation	13
4.4 The model as ideal	13
5 Items	15
5.1 SMOCC data: design	15
5.2 Empirical and fitted item response curves	15
5.3 Item fit	15
5.4 Item information at a given ability	15
5.5 Item information at a given age	15
6 Persons	17
6.1 Empirical and fitted person response curves	17
6.2 Person fit	17
6.3 Ability estimation	17
6.4 Measurement precision	17
6.5 Distribution of ability against age	17

7	Validity	19
7.1	Role of validity	19
7.2	Discriminatory validity	19
7.3	Concurrent validity	19
7.4	Predictive validity	19
8	Outcome	21
8.1	Application I: D-score as neurocognitive outcome at 1000 days	21
8.2	D-score of reference children at 2 years	21
8.3	D-score of pre-terms at 2 years	21
8.4	D-score of children in LMIC at 2 years	21
8.5	Comparison	21
9	Delay	23
9.1	Application II: D-score to identify delayed development	23
9.2	Longitudinal D-score patterns in different populations	23
9.3	Issues in defining developmental delay	23
9.4	Specificity in reference, pre-term and LMIC populations	23
9.5	Practical implications	23
10	Consequences	25
10.1	Application III: Long-term health consequences of delay in pre-terms	25
10.2	Relevance of long-term health outcomes	25
10.3	Predictive power of D-score	25
10.4	Practical implications	25
10.5	Opportunities and impact of early intervention	25
11	Discussion	27
11.1	Usefulness of D-score for monitoring child health	27
11.2	Opportunities for early intervention	27
11.3	D-score for international settings	27
11.4	D-score from existing instruments	27
11.5	Creating new instruments for D-score	27

Preface

This is an introductory booklet on the measurement of child development by means of the D-score. The D-score is a one-number summary that quantifies generic neurocognitive development for children with ages 0-4 years.

This is the first in a series of three booklets. The series consists of the following titles:

1. D-score for measuring neurocognitive development 0-4 years (this booklet)
2. D-score for international comparisons
3. D-score for creating better instruments

The development of this series was kindly supported by the Bill & Melinda Gates Foundation.

Chapter 1

Introduction

1.1 First 1000 days

1.2 Relevance of child development

1.3 Limitations of stunting

1.4 Measuring neurocognitive development

Chapter 2

Short history

2.1 Growth and development

2.2 Gesell maturation theory, Piaget stages, Kohlberg stages

2.3 One number for development

2.4 Current situation: Bayley, Griffiths, IQ, domains

Chapter 3

Comparisons

3.1 Types of comparisons needed

3.2 Problems of age-based measurement

3.3 What is a latent variable

3.4 Item response functions

3.5 Person response functions

3.6 Family of IRT models

Chapter 4

Rasch model

4.1 Rasch model

4.2 Perfect symmetry

4.3 Parameter separation

4.4 The model as ideal

Chapter 5

Items

5.1 SMOCC data: design

5.2 Empirical and fitted item response curves

5.3 Item fit

5.4 Item information at a given ability

5.5 Item information at a given age

Chapter 6

Persons

6.1 Empirical and fitted person response curves

6.2 Person fit

6.3 Ability estimation

6.4 Measurement precision

6.5 Distribution of ability against age

Chapter 7

Validity

7.1 Role of validity

7.2 Discriminatory validity

7.3 Concurrent validity

7.4 Predictive validity

Chapter 8

Outcome

8.1 Application I: D-score as neurocognitive outcome at 1000 days

8.2 D-score of reference children at 2 years

8.3 D-score of pre-terms at 2 years

8.4 D-score of children in LMIC at 2 years

8.5 Comparison

Chapter 9

Delay

9.1 Application II: D-score to identify delayed development

9.2 Longitudinal D-score patterns in different populations

9.3 Issues in defining developmental delay

9.4 Specificity in reference, pre-term and LMIC populations

9.5 Practical implications

Chapter 10

Consequences

- 10.1 Application III: Long-term health consequences of delay in pre-terms
- 10.2 Relevance of long-term health outcomes
- 10.3 Predictive power of D-score
- 10.4 Practical implications
- 10.5 Opportunities and impact of early intervention

Chapter 11

Discussion

- 11.1 Usefulness of D-score for monitoring child health
- 11.2 Opportunities for early intervention
- 11.3 D-score for international settings
- 11.4 D-score from existing instruments
- 11.5 Creating new instruments for D-score
